

## AREMIS ADMINISTRATION SYSTEM

The AREMIS Administration System is the core module of the AREMIS product line. The core module handles various issues in regards to the installation, the organizational structure and parameters of the systems installed at each installation site.

The Name and Address module is a central repository of names and addresses created from all AREMIS products thus avoiding duplication of information.

Through the password creation function each user is assigned a user name and password. This function exists in all other AREMIS products thus enabling the administrator to distribute roles and access to the users.

The currency codes and currency rates functions enable the once off creation of currencies used in the AREMIS products and the updating of the daily rates. These can then be used by all products in the product line.
